Hi Ben,

Hope you're having a productive week, especially with *Biomedical Engineering Insights* around the corner.

I'm writing with an urgent matter regarding our 'Ocean Acidification: A Novel Approach' paper from the *Robotics World Expo Proceedings*. I've just received some unexpected and rather critical feedback from a review panel that seems to be directly related to the National Endowment for Arts' interest in your new \$1M grant.

They're specifically looking at how our "novel approach" could be reframed or expanded to align with certain policy initiatives they're considering, directly impacting potential future project collaborations and even the public perception of the grant's scope. They've identified a few key areas in the manuscript that need immediate clarification and slight modification to better reflect this broader applicability, especially given your known insights on relevant policies.

The timeline on this is incredibly tight; they need our revised input by ****tomorrow afternoon**** to be considered for an expedited review. This is a significant opportunity to further secure the grant's impact and open new doors.

I've collated all their specific comments and drafted the necessary updates in the attached file: 'manuscript_updates.docx'. Please review it **immediately** and provide your input. We need to submit this ASAP.

Best,

Liam
